

This unit conditions the current on three polarities: Live line, Neutral line, and Ground line.

Load is your equipment's current hungry schematic.
Source is your electrical utility's supply of power. (Power from the "wall.")
Note **red tips** to determine polarity and relationship between source and load.

Pinch both copper rods of each polarity together and solder your lead to both simultaneously. As this is 20mm², a large iron is necessary. (We use 150 Watts.)
